## Welcome

Amazon EC2 Instance Connect enables system administrators to publish one-time use SSH public keys to their EC2 instances, providing users a simple and secure way to connect to their instances. For more information, see Connecting to your Linux instance using EC2 Instance Connect.

This document was last published on November 2, 2020.

# **Actions**

The following actions are supported:

• SendSSHPublicKey (p. 3)

## SendSSHPublicKey

Pushes an SSH public key to the specified EC2 instance for use by the specified user. The key remains for 60 seconds.

## Request Syntax

```
{
   "AvailabilityZone": "string",
   "InstanceId": "string",
   "InstanceOSUser": "string",
   "SSHPublicKey": "string"
}
```

## **Request Parameters**

For information about the parameters that are common to all actions, see Common Parameters (p. 7).

The request accepts the following data in JSON format.

```
AvailabilityZone (p. 3)
   The Availability Zone in which the EC2 instance was launched.
   Type: String
   Length Constraints: Minimum length of 6. Maximum length of 32.
   Pattern: (\w+-){2,3}\d+\w+$
   Required: Yes
Instanceld (p. 3)
   The ID of the EC2 instance.
   Type: String
   Length Constraints: Minimum length of 10. Maximum length of 32.
   Pattern: ^i-[a-f0-9]+$
   Required: Yes
InstanceOSUser (p. 3)
   The OS user on the EC2 instance for whom the key can be used to authenticate.
   Type: String
   Length Constraints: Minimum length of 1. Maximum length of 32.
   Pattern: ^[A-Za-z_][A-Za-z0-9\\@\\._-]{0,30}[A-Za-z0-9\\$_-]?$
   Required: Yes
SSHPublicKey (p. 3)
```

The public key material. To use the public key, you must have the matching private key.

#### AWS EC2 Instance Connect API Reference Response Syntax

Type: String

Length Constraints: Minimum length of 256. Maximum length of 4096.

Required: Yes

## Response Syntax

```
{
    "RequestId": "string",
    "Success": boolean
}
```

## **Response Elements**

If the action is successful, the service sends back an HTTP 200 response.

The following data is returned in JSON format by the service.

#### RequestId (p. 4)

The ID of the request. Please provide this ID when contacting AWS Support for assistance.

Type: String

#### Success (p. 4)

Is true if the request succeeds and an error otherwise.

Type: Boolean

#### **Errors**

For information about the errors that are common to all actions, see Common Errors (p. 9).

#### **AuthException**

Either your AWS credentials are not valid or you do not have access to the EC2 instance.

HTTP Status Code: 400

#### EC2InstanceNotFoundException

The specified instance was not found in the specified Availability Zone.

HTTP Status Code: 400

#### InvalidArgsException

One of the parameters is not valid.

HTTP Status Code: 400

#### ServiceException

The service encountered an error. Follow the instructions in the error message and try again.

HTTP Status Code: 500

#### **ThrottlingException**

The requests were made too frequently and have been throttled. Wait a while and try again. To increase the limit on your request frequency, contact AWS Support.

HTTP Status Code: 400

## **Examples**

### Push an SSH public key to an instance

This example sends the specified SSH public key to the specified instance in the specified Availability Zone. The key is used to authenticate the specified user.

#### Sample Request

```
POST / HTTP/1.1
Content-Type: application/x-amz-json-1.1
X-Amz-Target: AWSEC2InstanceConnectService.SendSSHPublicKey

{
    "AvailabilityZone": "us-east-2b",
    "InstanceId": "i-1234567890abcdef0",
    "InstanceOSUser": "ec2-user",
    "SSHPublicKey": "<ssh-public-key-material>"
}
```

# **Data Types**

The AWS EC2 Instance Connect API has no separate data types.

## **Common Parameters**

The following list contains the parameters that all actions use for signing Signature Version 4 requests with a query string. Any action-specific parameters are listed in the topic for that action. For more information about Signature Version 4, see Signature Version 4 Signing Process in the Amazon Web Services General Reference.

#### Action

The action to be performed.

Type: string

Required: Yes

#### Version

The API version that the request is written for, expressed in the format YYYY-MM-DD.

Type: string

Required: Yes

#### X-Amz-Algorithm

The hash algorithm that you used to create the request signature.

Condition: Specify this parameter when you include authentication information in a query string instead of in the HTTP authorization header.

Type: string

Valid Values: AWS4-HMAC-SHA256

Required: Conditional

#### X-Amz-Credential

The credential scope value, which is a string that includes your access key, the date, the region you are targeting, the service you are requesting, and a termination string ("aws4\_request"). The value is expressed in the following format: access\_key/YYYYMMDD/region/service/aws4\_request.

For more information, see Task 2: Create a String to Sign for Signature Version 4 in the Amazon Web Services General Reference.

Condition: Specify this parameter when you include authentication information in a query string instead of in the HTTP authorization header.

Type: string

Required: Conditional

#### X-Amz-Date

The date that is used to create the signature. The format must be ISO 8601 basic format (YYYYMMDD'T'HHMMSS'Z'). For example, the following date time is a valid X-Amz-Date value: 20120325T120000Z.

Condition: X-Amz-Date is optional for all requests; it can be used to override the date used for signing requests. If the Date header is specified in the ISO 8601 basic format, X-Amz-Date is

not required. When X-Amz-Date is used, it always overrides the value of the Date header. For more information, see Handling Dates in Signature Version 4 in the *Amazon Web Services General Reference*.

Type: string

Required: Conditional

#### X-Amz-Security-Token

The temporary security token that was obtained through a call to AWS Security Token Service (AWS STS). For a list of services that support temporary security credentials from AWS Security Token Service, go to AWS Services That Work with IAM in the IAM User Guide.

Condition: If you're using temporary security credentials from the AWS Security Token Service, you must include the security token.

Type: string

Required: Conditional

#### X-Amz-Signature

Specifies the hex-encoded signature that was calculated from the string to sign and the derived signing key.

Condition: Specify this parameter when you include authentication information in a query string instead of in the HTTP authorization header.

Type: string

Required: Conditional

#### X-Amz-SignedHeaders

Specifies all the HTTP headers that were included as part of the canonical request. For more information about specifying signed headers, see Task 1: Create a Canonical Request For Signature Version 4 in the Amazon Web Services General Reference.

Condition: Specify this parameter when you include authentication information in a query string instead of in the HTTP authorization header.

Type: string

Required: Conditional

## **Common Errors**

This section lists the errors common to the API actions of all AWS services. For errors specific to an API action for this service, see the topic for that API action.

#### AccessDeniedException

You do not have sufficient access to perform this action.

HTTP Status Code: 400

#### IncompleteSignature

The request signature does not conform to AWS standards.

HTTP Status Code: 400

#### InternalFailure

The request processing has failed because of an unknown error, exception or failure.

HTTP Status Code: 500

#### InvalidAction

The action or operation requested is invalid. Verify that the action is typed correctly.

HTTP Status Code: 400

#### InvalidClientTokenId

The X.509 certificate or AWS access key ID provided does not exist in our records.

HTTP Status Code: 403

#### **InvalidParameterCombination**

Parameters that must not be used together were used together.

HTTP Status Code: 400

#### **InvalidParameterValue**

An invalid or out-of-range value was supplied for the input parameter.

HTTP Status Code: 400

#### InvalidQueryParameter

The AWS query string is malformed or does not adhere to AWS standards.

HTTP Status Code: 400

#### MalformedQueryString

The query string contains a syntax error.

HTTP Status Code: 404

#### MissingAction

The request is missing an action or a required parameter.

HTTP Status Code: 400

#### MissingAuthenticationToken

The request must contain either a valid (registered) AWS access key ID or X.509 certificate.

HTTP Status Code: 403

#### MissingParameter

A required parameter for the specified action is not supplied.

HTTP Status Code: 400

#### **NotAuthorized**

You do not have permission to perform this action.

HTTP Status Code: 400

#### OptInRequired

The AWS access key ID needs a subscription for the service.

HTTP Status Code: 403

#### RequestExpired

The request reached the service more than 15 minutes after the date stamp on the request or more than 15 minutes after the request expiration date (such as for pre-signed URLs), or the date stamp on the request is more than 15 minutes in the future.

HTTP Status Code: 400

#### ServiceUnavailable

The request has failed due to a temporary failure of the server.

HTTP Status Code: 503

#### **ThrottlingException**

The request was denied due to request throttling.

HTTP Status Code: 400

#### ValidationError

The input fails to satisfy the constraints specified by an AWS service.

HTTP Status Code: 400
